

## Amendments to the Claims

- 1 1. (currently amended) A method for concealing errors in an ~~intra-frame~~  
2 intra-frame of a compressed video, comprising:
  - 3 decoding the intra-frame to a plurality of macroblocks, each
  - 4 macroblock including a plurality of pixels arranged in a rectangular array;
  - 5 locating a lost macroblock during the decoding;
  - 6 concealing pixels along an outer boundary of the lost macroblock
  - 7 from nearest candidate pixels along outer boundaries of macroblocks
  - 8 immediately adjacent to the lost macroblock; and
  - 9 concealing all other pixels in the lost macroblock from nearest
  - 10 candidate pixels selected from previously concealed pixels in the lost
  - 11 macroblock.
- 1 2. (original) The method of claim 1, in which the candidate pixels are  
2 directly above, below, to the left and to the right of a current pixel to be  
3 concealed.
- 1 3. (original) The method of claim 1, in which the pixels in the lost block are  
2 concealed in a spiral order, starting at an upper left corner of the lost block,  
3 and running then along the outer boundary, and ending in the middle of the  
4 lost block.

- 1    4. (original) The method of claim 1, further comprising:
  - 2       sorting the candidate pixels  $C_i$  in an ascending order in terms of
  - 3       intensity values of the candidate pixels;
  - 4       determining a median value of the ordered candidate pixels;
  - 5       determining a difference  $Diff_i$  between the intensity value of the  $i^{th}$
  - 6       candidate pixel and the median intensity value;
  - 7       determining a distance  $Dist_i$  between the  $i^{th}$  candidate pixel and the
  - 8       current pixel;
  - 9       determining an evaluation score  $S_i$  for the  $i^{th}$  candidate pixel as sum
  - 10      of  $Diff_i$  and  $Dist_i$ ;
  - 11      if the evaluation score  $S_i$  is greater than a threshold  $T$ , then rejecting
  - 12      the  $i^{th}$  candidate pixel; and
  - 13      linearly interpolating remaining candidate pixels and assign an
  - 14      interpolated value to the current pixel  $p$  according to

$$15 \quad p = \left( \sum_i \frac{C_i}{Dist_i} \right) / \left( \sum_i \frac{1}{Dist_i} \right).$$

- 1    5. (original) The method of claim 4, in which the threshold is twenty.
- 1    6. (original) The method of claim 4, in which the distance metric is the
- 2      number of pixels from the current pixel to the candidate pixel.

- 1    7. (new) The method of claim 1, further comprising:
  - 2       encoding an uncompressed video into inter-frames and intra-frames to
  - 3       produce the compressed video;
  - 4       replicating macroblocks along edges of each inter-frame; and
  - 5       appending the replicated macroblocks at an end of the inter-frame.
